The present sequence represents the heavy chain variable region of murine/human interleukin-4 (II-4) chimeric antibody 3B9. The specification describes chimeric and humanised II-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating II-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic defratitis, atopic astima, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess II-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans.
                                                                                             New DNA molecules encoding recombinant antibodies useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Holmes SD, Sylvester DR;

                                                                                                                                                                                                                                                     A human/mouse chimeric antibody heavy chain variable region was constructed (given in AAR70191) that contained the mouse anti-human IL-4 MAD 3B9 variable region including 3 CDRs (AAR70198-200) and a human antibody signal peptide (AAR70193). The construct was used (for humanized antibody production.

This sequence represents the light chain of the chimeric 3B9 antibody of the invention. The antibody is a chimeric or mumanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease.

                                                                                                                                                                                                                         Gaps
              AAQ70612 codes for human interleukin-6 binding inhibitor, the polypeptide disperibed in AARS612. This polypeptide lihibite the binding of human II-6 to its receptor, and can therefore be useful in the treatment of a variety of autoimmune diseases; specifically in the treatment of rheumatoid architis, septic shock due to bacterial infection and multiple myeloma. (Updated on 25-MAR-2003 to correct PN field.)

and variable framework region from human acceptor Ig LC or HC sequence. The invention is useful for preventing or treating an amyloidogenic disease or Alzheimer's disease in a patient. The invention is also useful for in vivo imaging amyloid deposits in a patient. The present amino acid sequence represents a mouse 3D6/10D5 variable light (VL) chain or variable heavy (VH) chain protein of the invention.

This is the amino acid sequence of the mature peptide from the murine anti-protein C monoclonal antibody HPC-4 heavy chain variable region. HPC-4 recognises the activation peptide region (AAR88106) of the heavy chain of protein C, a vitamin K-dependent plasma protein zymogen. Protein C is converted to activated protein C (APC) by cleavage between the Arg-Leu amino acid contained within the activation peptide sequence. HPC-4 prevents protein C activation to APC by binding to this region. The DNA sequences encoding the variable regions of the heavy and light chains of the antibody (AAT09229-302) were used to construct humanised antibodies using the PCR primers AAT09303-9. The humanised antibodies are useful as inhibitors of coagulation and can be used for the treatment of tumours by inhibiting the anticoagulant activity of APC by preventing

Protein C is converted to activated protein C (APC) by cleavage between the Arg-Leu amino acid contained within the activation peptide sequence. HPC-4 prevents protein C activation to APC by binding to this region. The DNA sequences encoding the variable regions of the heavy and light chains of the antibody (AAT09299-302) were used to construct humanised antibodies using

generate constructs (see AAQ75914-7) encoding fragments of an antibody to the human IL-6 comprising (a) a light chain with (i) a variable region containing 3 complementarity determining regions (CDR) (AAR77201-3) inserted into several framework regions (FR) (AAR77204-7) and (ii) a human light chain constant region and (b) a heavy chain with (i) a variable region containing 3 CDR (AAR77212-4) inserted into an FR (AAR77215-8) and (ii) a human light chain constant region. The FR of the light chain may be mouse derived (AAQ75888) or from the human antibody 2 Chain FR may also be mouse derived (AAQ75889) or from the human antibody disorders. The antibodies can be used in the treatment of IL-6 related disorders. The antibodies are useful as they have low antigenicity due to the use of human derived sequences and low antigenicity mouse derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      80 YNPALKGRLTISKDISNNQVFLKIASVVTADTATYYCAR---MEDYDEAMDYWGQGTSVT 136

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel herbicide binding protein which can confer herbicide resistance activity. Crop plants, such as soybean, cotton, tobacco, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tomato, alfalfa, lettuce, maize, wheat, sorghum, rye, bananas, barley, oat, turf grass, forage grass, sugar cane, pea, field bean, rice, pine, poplar, apple, grape, citrus or nut plants, transformed with a herbicide binding protein gene are resistant to the herbicide. Hence, weeds can be selectively controlled in a field of the transformed crops. The plants are substantially resistant or tolerant to herbicides such as paraquat or diquat, that inhibit photosynthesis by accepting
                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                               9

raising, in an infected individual, an antibody able to bind to the hypervariable 1 (HVR1) region of the envelope protein E2 of the infecting HCV strain. The different groups of peptides rad administered sequentially to raise antibodies, helper T-lymphocytes, and cytotoxic T-lymphocytes which are cross-reactive to the HVR1 region of the infecting HCV. The vaccines are useful for preventing and treating chronic HCV infections. ABG67186-ABG67189 represent variable regions of human 1gG1 antibody heavy chain.
                                                                                                                                                                                                                                            4

```
lipid peroxidation or by blocking electron transport in photosystem II. The herbicide binding proteins advantageously sequester the herbicide, e.g. at the cell surface or in the vacuoles of a traated plant. Sequestration at the cell surface prevents the entry of the herbicide and the chis into the chall surface prevents the entry of the herbicide and exert any significant cytotoxic effect. The herbicide binding protein inhibits the mobility of the herbicide from the application site to the whole plant preventing the herbicide from the application site to the organs. Additionally, tolerant plants can be produced against herbicides that have more than one target site.
      electrons from photosystem I thus generating free radicals which cause

monoclonal antiid ig heavy chain precursor V region (IdBS.7) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: P70174
R;Perfetti, V.; Borden, P.; Tao, M.H.; Morrison, S.L.; Kabat, E.A.
Mol. Immunol. 28, 505-515, 1991
A;Title: Specificity and variable region CDNA sequence of an isogeneic monor A;Reference number: P70174; MUID:91287738; PMID:1712074 A;Accession: PT0174
A;Molecule type: mRNA
A;Residues: 1-143 <PRR>
A;Experimental source: strain BALB/c
C;Comment: 16155.7 is an antibody to anti-alpha (1-6) dextran.
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin

DB 2; Length 143; Score 543.5; DB 2 Pred. No. 2.3e-44; F;34-118/Domain: immunoglobulin homology <IMM> 85.9%; Query Match Best Local Similarity

Ig heavy chain precursor V-II region (Cess) - human C.Species: Homo sapiens (man)
C.Species: Homo sapiens (man)
C.Date: 17-Mar-1987 #sequence_revision 17-Mar-1987 #text_change 02-Sep-1997
C.Accession: A02090
R.Takahashi, N.; Noma, T.; Honjo, T.
Proc. Natl. Acad. Sci. U.S.A. 81, 5194-5198, 1984
A.Title: Rearranged immunoglobulin heavy chain variable region (V-H) pseudogene that del A.Reference number: A02090; MUID:84298107; PMID:6089186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A;Molecule type: mRNA
A;Residues: 1-147 <TAK>
A;Note: the sequence was determined from the differentiated gene
A;Note: the authors translated the codon GGG for residue 16 as Trp, TGG for residue 142
as Ser, and CAG for residue 147 as Ser

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                               US-09-759-112A-7
